

New Version of Virtually There

A new version of Virtually There has been successfully loaded to production. There were some smaller and customer specific items addressed in this implementation and the items detailed below should now be resolved:

- When displaying the itinerary, eTicket, and eInvoice the 12/24 time settings specified in the Configuration Tool are not being used
- If multiple passengers are displayed on the itinerary, the seat number information for some passengers is not being displayed
- When a flight is spanning the international dateline and spanning two days of travel, the sequence is incorrectly displayed
- When displaying the eTicket, taxes were displaying the correct value of the local currency, but showing the currency code incorrectly
- When displaying the eInvoice, the service fees for segments was not displaying
- Travelers opting out of Virtually There messages are receiving errors at the webpage, and are still receiving email messages
- The text displayed when travelers need to enter their email address from the homepage was incorrect. It needs to state :enter your email address or password”

The printable itinerary changes are scheduled for implementation tomorrow 11 of June. These changes will address the three items: font color, length of the printout, and a more organized layout.
